

Project 1: Calculator in Python

Objective

Build a menu-driven calculator supporting addition, subtraction, multiplication and division.

Problem Statement

Develop a console application that accepts two numbers and an operator and displays the result.

Features

Addition, subtraction, multiplication, division, invalid operator handling, division-by-zero handling.

Algorithm

1. Read first number.
2. Read operator.
3. Read second number.
4. Perform operation.
5. Display result.

Python Code

```
a=float(input())
op=input()
b=float(input())
if op=='+': print(a+b)
elif op=='-': print(a-b)
elif op=='*': print(a*b)
elif op=='/': print('Cannot divide by zero' if b==0 else a/b)
```

Sample Input

10 + 5

Sample Output

15

README

A beginner-friendly Python calculator project for interview preparation.

Interview Questions

1. Why use if-elif? Answer: To choose one operation.
2. Why use float()? Answer: To support decimal numbers.
3. How is division by zero handled? Answer: Using a condition before division.
4. Difference between int and float? Answer: int stores whole numbers; float stores decimals.
5. How can this project be improved? Answer: Add GUI using Tkinter.
