

Calculator Project Using Python

Objective

To develop a simple calculator application that performs basic arithmetic operations.

Problem Statement

Create a menu-driven calculator using Python that accepts user input and performs addition, subtraction, multiplication, and division.

Features

- Addition
- Subtraction
- Multiplication
- Division
- Invalid operator handling
- Division-by-zero handling

Algorithm

1. Start
2. Read first number
3. Read operator
4. Read second number
5. Perform calculation
6. Display result
7. Stop

Python Code

```
a=float(input('First Number: '))
op=input('Operator (+, -, *, /): ')
b=float(input('Second Number: '))
if op=='+':
    print(a+b)
elif op=='-':
    print(a-b)
elif op=='*':
    print(a*b)
elif op=='/':
    print('Cannot divide by zero' if b==0 else a/b)
else:
    print('Invalid Operator')
```

Sample Input

First Number: 10
Operator: +
Second Number: 5

Sample Output

15

Conclusion

This project demonstrates the use of conditional statements, user input, and arithmetic operators in Python.
